The present invention describes methods of obtaining immunogenic CC proteins from Neisseria genomic sequences. A81453 to A82414 represent CC specifically claimed Neisseria meningitidis genomic DNA sequences; A81260 CC to A81303 and B25620 to B25663 represent Neisseria MDA sequences and CC their corresponding proteins; A81254 to A81259 and A81304 to A81321 CC represent PCR primers used in the isolation of Neisseria meningitidis DNA Sequences; and A81322 to A81452 represent Neisseria meningitidis MenB CC sequences; and A81322 to A81452 represent Neisseria meningitidis MenB CC polynuclectide ORF sequences, which are all used in the exemplification CC of the present invention. The nucleic acid sequences, protein sequences, CC and antibodies against them, can be used as a medicament (or in the CC manufacture of a medicament) for treating, preventing or diagnosing CC infection due to Neisserial bacteria. For example, some of the identified CC proteins could be components of vaccines against Meningococcus B; against CC all serotypes; and/or against all pathogenic Neissariae. Identification of sequences from the bacterium will also facilitate production of Diological probes, particularly organism-specific probes. Attempts to make efficacious Meningococcus B vaccines have failed mainly due to antigen tolerance. Multivalent vaccines have failed mainly due to the control of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Isolated nucleotide sequences of Neisseria meningitidis which can used in the diagnosis and treatment of N. meningitidis infection other Neisserial infections, for example, N.gonorrhoea -

                                                                                                                                                                                                                                                                                                                                           temperature and in organic solvents, making them superior for use in production of pure chiral compounds used in pharmaceutical, agricultural and other chemical industries. A method is claimed for transferring an amino group from an amino acid to an alpha-keto acid using a claimed esterase. The enzymes may also be useful as ripening starters in cheese making, in lignin removal in paper and pulp manufacture, in carbohydrate derivative synthesis, in fermentable sugar production from lignocellulosic waste, in the study of plant wall structure, plant resistance to disease and organic matter decomposition and to select plants bred for production of highly degradable animal feeds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This DNA sequence codes for whale mat sample 11.801 esterase es9 (W23079). Newly identified polynucleotides (T79321-40) encoding esterases (W23069-88), some of which are claimed, can be used for recombinant production of the enzymes in host cells, and as probes to identify related sequences. The esterases are stable at high
                                                                                                                                                                                                                                                                                                                 Sequence 779
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acid encoding heat stable esterase from thermophilic bacteria - which is active in organic solvents, useful in cheese paper manufacture, and to study plant resistance to disease

                                                                                                                                                                                                                                                                                X20500-21243 represent polynucleotide sequences from the genome of Treponema pallidum. The sequences can be used for detection, diagnosis, characterisation, prevention and therapy for T. pallidum infections, particularly syphilis. They can also be used for detecting diseases related to Borrelia infections in animals, and for the production of biosynthetic products such as enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                             New isolated Treponema pallidum nucleic acids - used to develop products for the detection, diagnosis, characterisation, prevention and therapy of T. pallidum infections, particularly syphilis

Patent No. 6143536

GENERAL INFORMATION:
APPLICANT: IMANAKA, Tadayuki
APPLICANT: TAKAGI, Masahiro
APPLICANT: MORIKAWA, Masaaki
TITLE OF INVENTION: DNA Encoding A Thermostable DNA Polymerase
NUMBER OF SEQUENCES: 16
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
